# Network programmability with HIKe and eCLAT

**BORSISTI DAY 2021**

**GIORNATA DI INCONTRO  
BORSE DI STUDIO GARR  
"ORIO CARLINI"  
ROMA  
21/04/2021**

Università degli studi di Tor Vergata - Dipartimento di ingegneria elettronica

# Setting up the scene - Network programmability

---

- ❖ Network programmability (dataplane programmability)

- ❖ Micro-programmability

# So what?

---

Reaction to sudden changes!

Think about new ways for the network to operate!

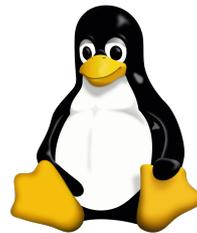

# Our take - eBPF/XDP dataplane on Linux

XDP - *eXpress Data Path*

eBPF - extended Berkeley Packet Filter

- ❖ eBPF is a virtual machine abstraction and a programming language that can be executed inside the Linux kernel

- ❖ XDP uses eBPF to define packet processing operations that are executed very "early", as soon as the packet is received from the NIC  
→ **very efficient!!**

# eBPF/XDP limitations

❖ eBPF/XDP is great for performance, but...

- eBPF programming requires deep technical skills (and it is very painful also for the experts!!)
- eBPF/XDP does not provide good programming abstractions/simplifications for "composing" eBPF programs

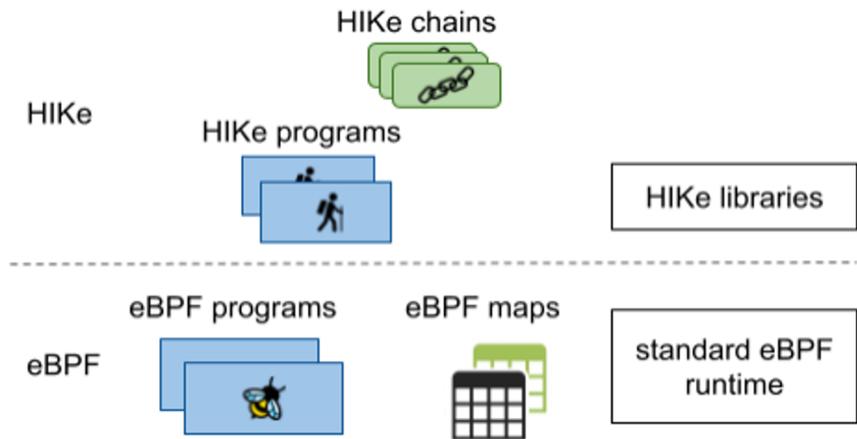

❖ ***We need a better model !! “easy and accessible to everyone”***

# HIKe and eCLAT: two solutions for the complexity

## 1) HIKe - Hybrid Kernel/eBPF data plane

HIKe is a programmable data plane architecture:

- dynamic composability of eBPF programs into “chains”
- support of “chain-in-chain” calls for reusability
- abstraction of an execution environment

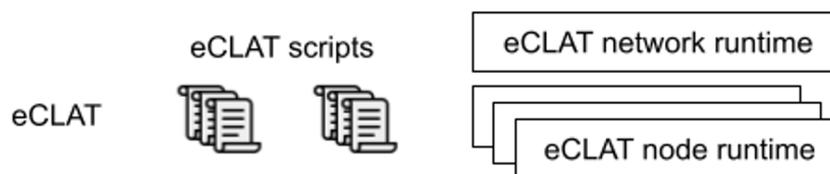

# HIKe and eCLAT: two solutions for the complexity

---

## 2) eCLAT - eBPF Chains Language And Toolset

eCLAT provides a high-level programming abstraction to HIKe

- support of network-wide operations (chaining and deployment)
- from node programmability to network programmability

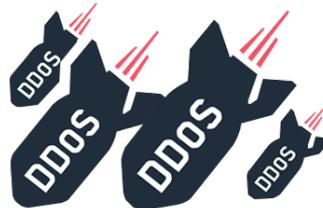

# My goals

1. contribute to the design, development and comparison of HIKe and eCLAT network programmability frameworks based on eBPF

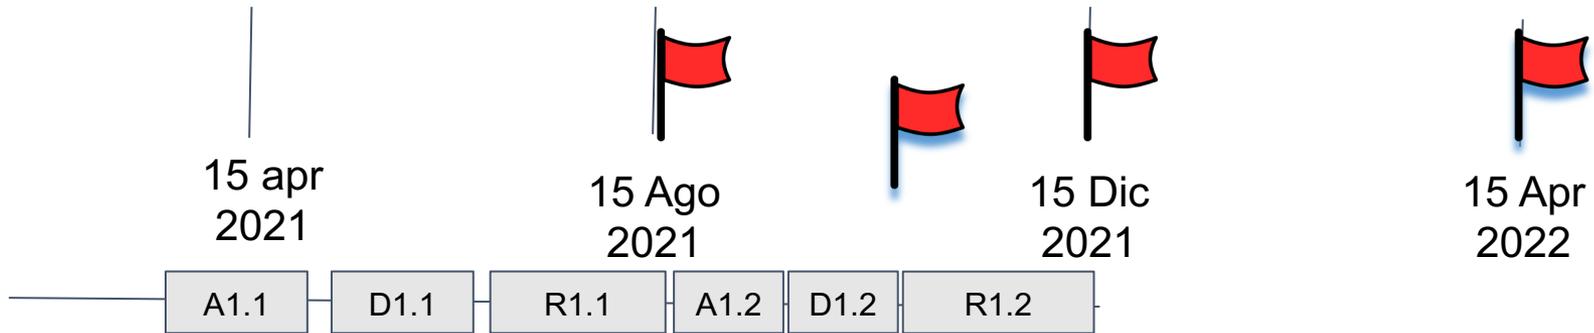

~~eBPF~~ → UBPF

2. focus on network programmability applications to network monitoring, to the identification of network and traffic anomalies and to dynamic reaction/mitigation of DDoS.

# Time program, expected results, interaction with GARR

## 1. Design and comparison of network programmability frameworks

## 2. Applications to network monitoring, identification of anomalies, dynamic reaction

A : Analysis  
D : Design  
R : development and Release

# Thanks for your attention!

---
