Outline

- **All optical access network (GPON): TV+IP**
- Save energy in TLC networks
- QoS management: Service Level Agreement
- Software Defined Network approach
- Test bed
- QoS measurements
- Energy saving vs QoS: results
- TV over fiber
- Optical wireless
- Conclusions

NGN TEST BED

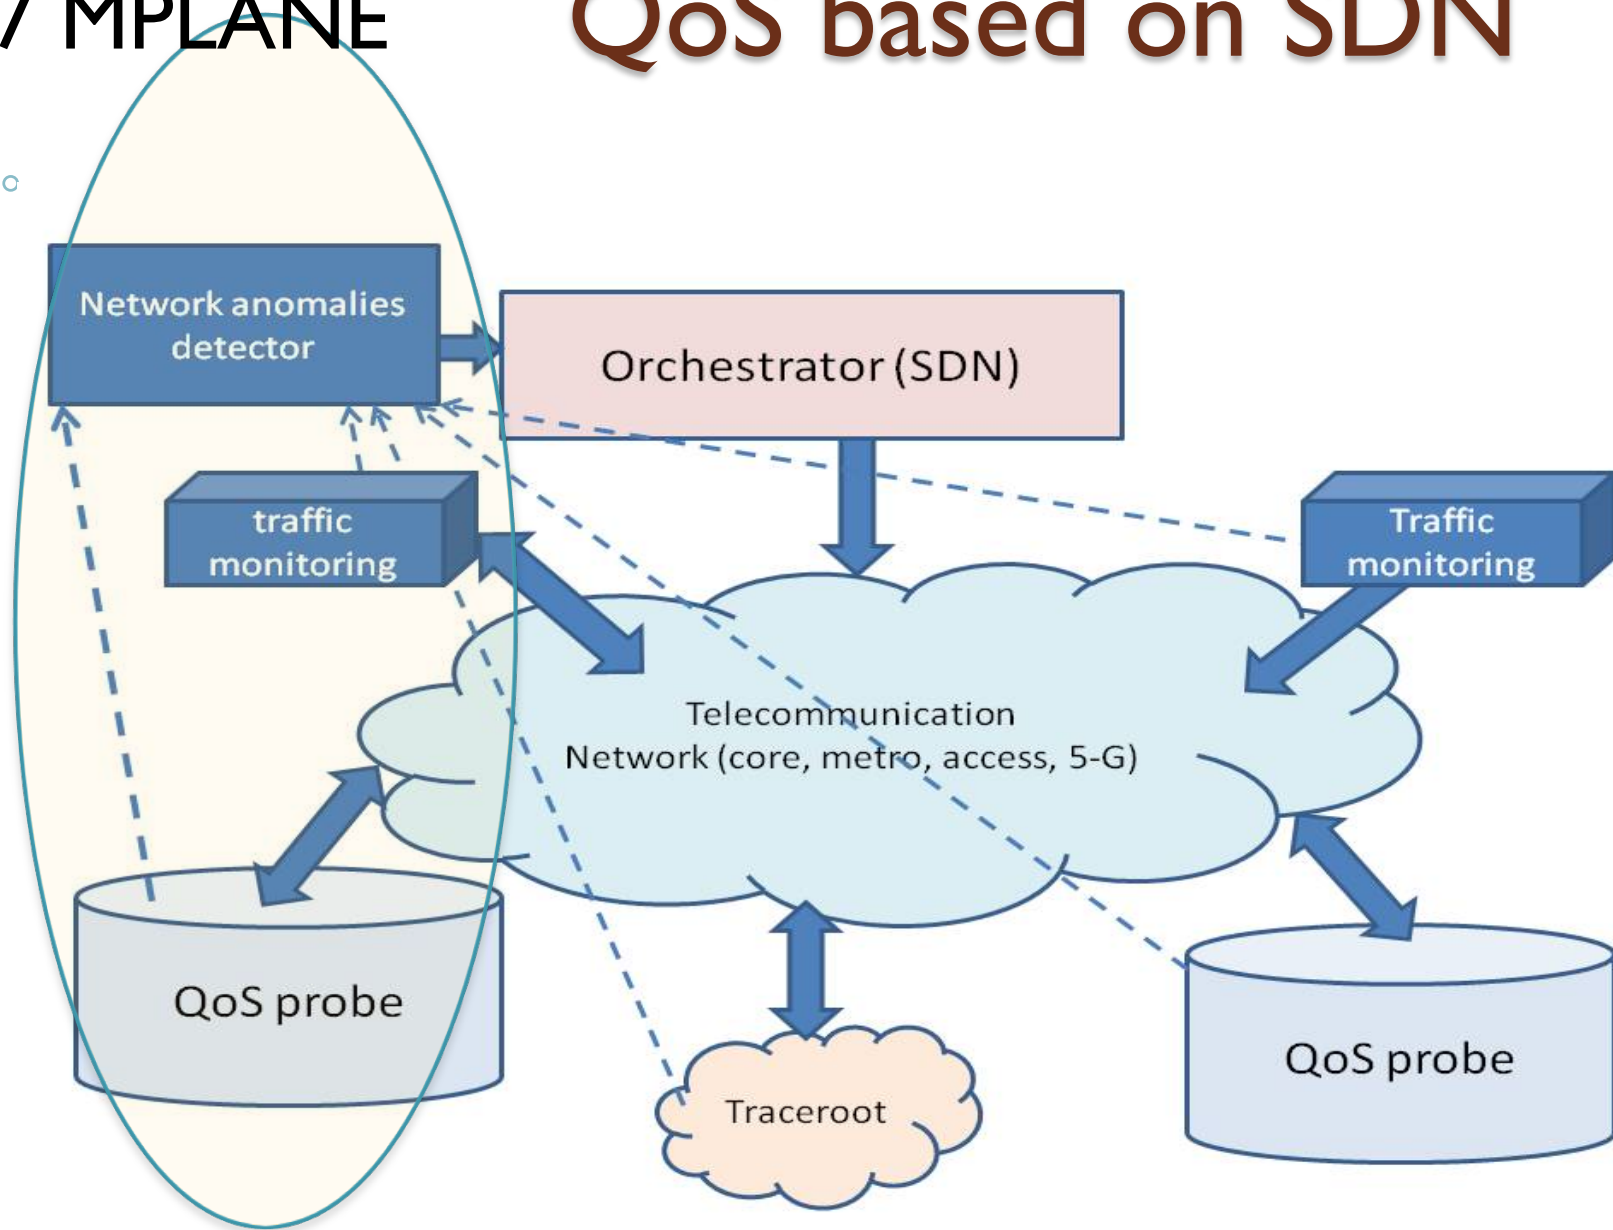

Energy saving in TLC (FP7 TREND)

- In core networks switch-off of links with low traffic.
- Several algorithms defined
- Fixed Upper Fixed Lower (FUFL): Both the routing of IP traffic (upper virtual layer) and the realization of light paths (lower WDM layer) are fixed over time.
- We allow to shift traffic between parallel light paths though. Line cards of empty light paths are switched off.

FP7 MPLANE

QoS based on SDN

QoS measurements

- Throughput, Packet loss, jitter, delay (RTT)
- Generally speed test based on TCP. It does not measure line capacity!
- In MPLANE QoS measurement also to verify SLA:
 - TCP test for Layer 4
 - UDP test for Layer 2 (line capacity)

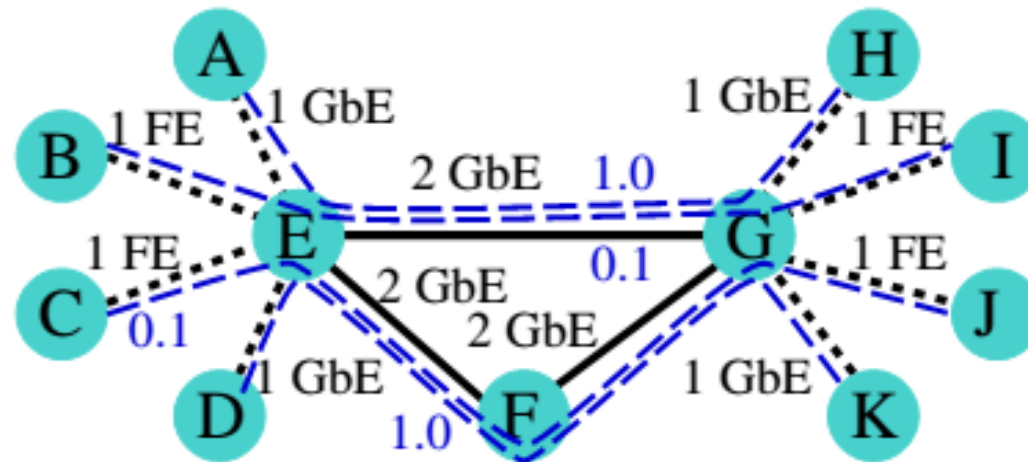

SDN approach

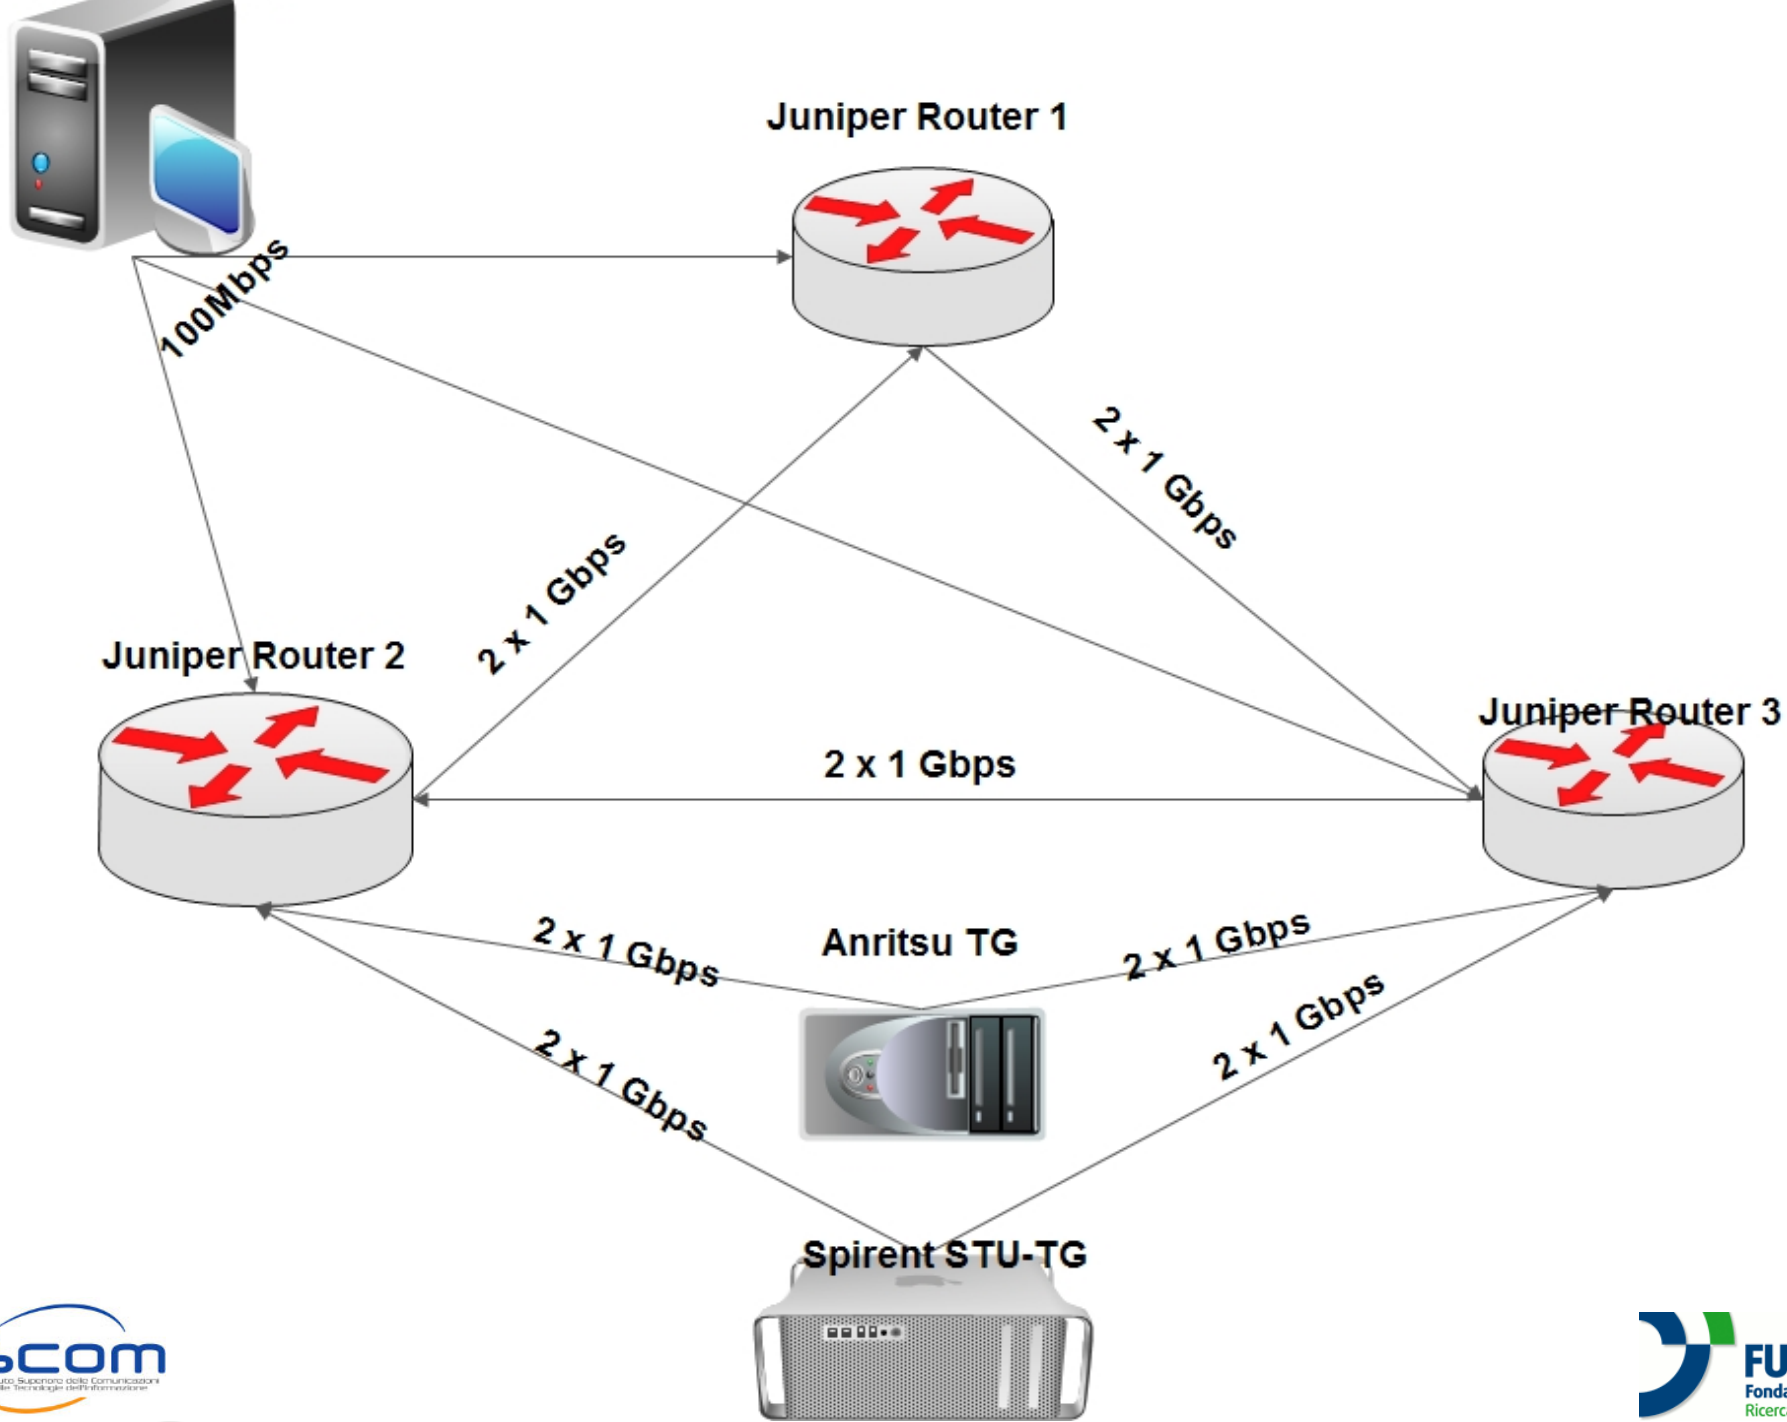

- Input for orchestrator: traffic measurement to switch off links with low load;
- Input for orchestrator to identify network anomalies
- Reaction to manage routers by means of Simple Network Management Protocol (SNMP)

Traffic generated

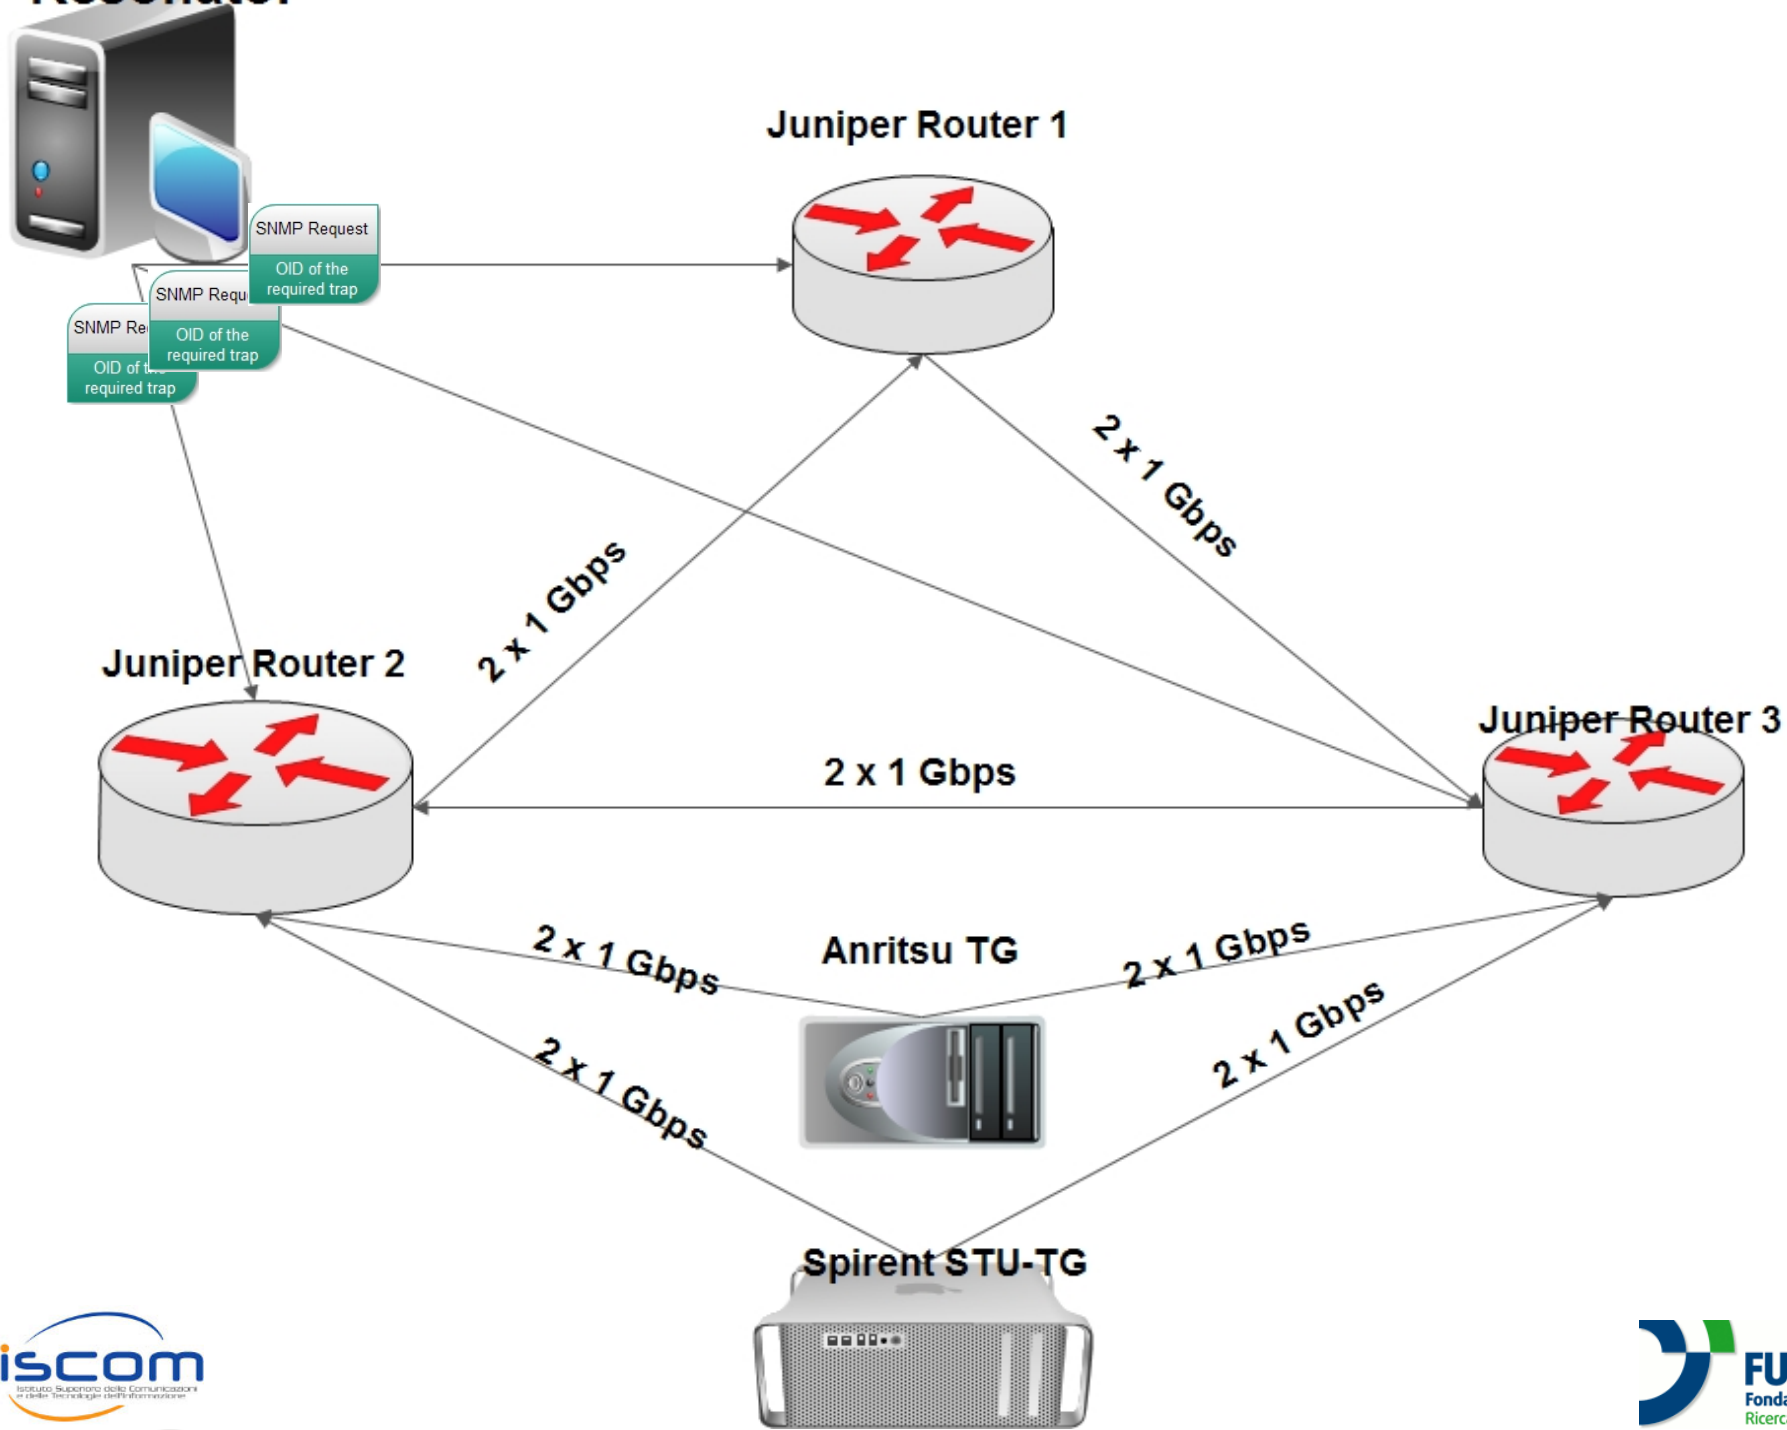

Traffic Demand	Traffic Type	Min [Gbps]	Max [Gbps]	Period [s]
A-H	random	0.97	1	-
B-I	sine-like	0	0.1	200
C-J	sine-like	0	0.1	200
D-K	random	0.97	1	-

QoS control based on SDN

Optical spectrum of RF signal

Optical wireless tests on Gpon

Conclusions

- Complete optical network for TV and IP services
- Experimental demonstration of energy saving and QoS control based on SDN
- In this experimental approach QoS and Energy Saving do not introduce conflicts in the procedures
- TV over fiber
- Optical wireless
- Investigation on wider networks
- Further investigation on App
- SMNP vs OPENFLOW
