Canonical new Italian OpenStack cloud

Ubuntu is the most popular operating system used in OpenStack clouds, according to the Foundation's user survey. At the Summit in Boston this week Ubuntu's makers Canonical announced a new large-scale OpenStack deployment. GARR is a large Italian research and education consortium with 4 million users across 1,200 research sites. It's built a federated OpenStack cloud across five sites in Europe. GARR says it's automated the OpenStack management and can now stand up new OpenStack clouds at research sites in as little as 20 minutes.
